Replit Proof of Use

Milestone2Cash uses Replit to host its shared functional prototype. This evidence records an availability check on 24 October and a completed six-case browser workflow test on 25 October 2026.

Registered team	Lets go
Project	Milestone2Cash Proof-to-Cash
Competition track	Domain 2 - ALPHA RED
Project leader	Jiazhong Yang
Replit use	Application workspace, build/run environment and public demonstration hosting
Availability check	24 October 2026, 22:14 MYT (14:14 UTC)
Browser workflow run	25 October 2026, approximately 01:30-01:51 MYT

Public deployment evidence

https://milestone-2-cash-proof-to-cash.replit.app/

In the 24 October availability check, the public URL returned HTTP 200 with the page title “Milestone2Cash · Proof-to-Cash”. The health endpoint returned HTTP 200 and reported an available application database. The subsequent browser run used this same published application.

Endpoint	Observed result
/	HTTP 200; text/html; Milestone2Cash frontend
/health	HTTP 200; application/json; status: ok; service: proof-to-cash; stage: reconciliation; database: ready; mode: demo

Open the public health endpoint

The availability check was read-only. The separate 25 October workflow run uploaded the supplied synthetic files and recorded approved demo payments through the interface.

Application hosted on Replit

The deployment serves the React/Vite frontend and Node.js API together. SQLite stores synthetic project, invoice, bank-evidence, approval and audit records. Local OCR assists evidence extraction; the server may call the hosted DeepSeek API for restricted text tasks. Finance approval is required before matching evidence becomes a recorded payment.

Browser workflow verification

All six F01-F06 cases in the supplied friend-test package passed through actual browser UI actions on 25 October 2026. This was an agent-operated functional test using synthetic data, not an independent SME user study.

F01 - approval	Finance could not complete the milestone. PM created an RM6,000 draft but could not approve it. Owner approval issued one invoice.
F02 - reminder	The interface labelled the English output AI draft. It remained editable and unsent until explicit simulated sending. No real message left the app.
F03 - partial payment	The first RM9,000 receipt fields were correct without correction. Bank matching alone left RM0 received. Approval recorded RM9,000; re-uploading the same image did not create another payment.
F04 - promise	RM9,000 promised for 28 October was extracted correctly. Confirmation left the actual balance unchanged. The seven-day-late scenario moved only the expected receipt to 4 November.
F05 - settlement	The final CSV added one bank record without posting payment. The second RM9,000 receipt settled the invoice only after review and approval. Refresh preserved settlement; duplicate CSV import added zero records.
F06 - access and layout	A Rantau identity could not read the Lumen invoice. Return to Lumen preserved settlement. A 390 x 844 browser viewport, English/Chinese/Malay and light/dark themes passed the inspected checks.

Observed result and scope

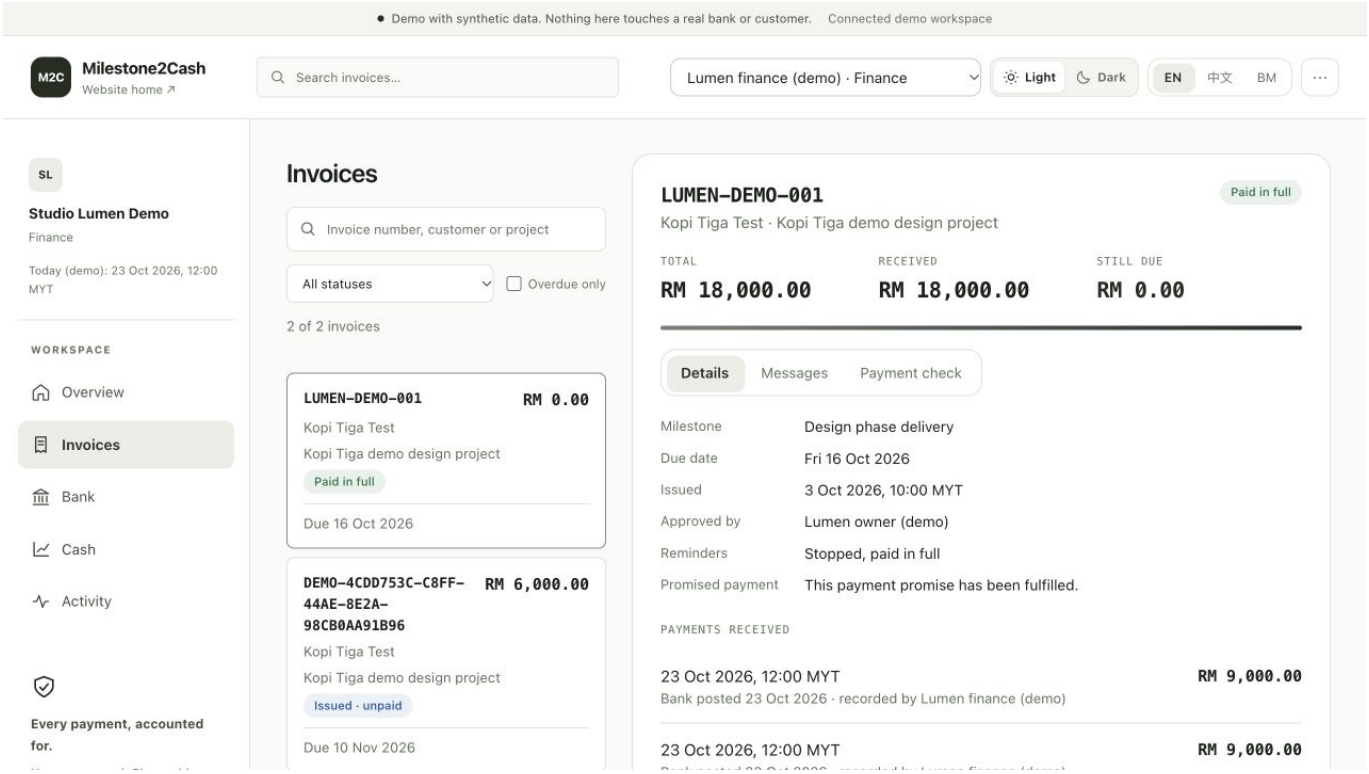

The reminder, two receipt extractions and payment-promise extraction displayed AI results in the interface. Both receipts and the promise required no manual correction; the three extraction views each showed 95% confidence. That display value is not measured accuracy. These examples do not rerun or replace the separate 40-receipt / 40-reply benchmark.

The run left LUMEN-DEMO-001 with RM18,000 received and RM0 outstanding, represented by two RM9,000 payments. The separate F01 invoice remains unpaid for RM6,000. No data reset, pause or redeployment was performed. Page-refresh persistence was verified; durability across redeployment was not.

The step-by-step record, structured results and screenshots are included under submission/validation/ in the accompanying materials. No staff-time saving or independent member sign-off is claimed.

Recorded settlement evidence

The actual published interface after the run shows the main invoice fully paid, reminders stopped and two approved RM9,000 payments.

Screenshot captured during the 25 October browser test. The application deliberately uses a fixed synthetic clock of 23 October 2026; the displayed record dates are demo dates.

Source and deployment boundaries

The prepared source snapshot is c4386784c9b5dacf44cc97e57a0c731931da36da. The live health response does not expose a Git commit, so the browser test does not independently certify the exact deployed revision. A previous republish reset the demonstration ledger and uploads; durable financial storage is not claimed.

The repository records the team workspace as @lijieheng18/Milestone2Cash-Proof-to-Cash. Its workspace URL was not anonymously accessible in the 24 October check. Judges should use the working public deployment. The GitHub repository is public. Repository visibility was verified on 25 October 2026, and the source repository link below is publicly accessible.

Deployment instructions

Participant Handbook section 10.6 permits a live deployment URL as Replit use evidence. The team should maintain access during judging. Bank, messaging and tax integrations remain simulated.
